```
This sequence represents the heavy chain variable region of the monoclonal antibody (MAB), KRIXI. This MAB produced by the cell line of the invention, specifically recognises the wild type factor VIII light chain. KRIXI can be used to inhibit the binding of factor VIII light willebrand factor in a dose dependant manner. The new cell line KRIXI, is deposited with the Belgian Coordinated Collections of Micro-organisms, under accession number LMBP 5089CB. KRIXI, or fragments of it, optionally with a thrombolytic agent, are useful for the treatment and/or prevention of hemostasis, coagulation disorder or thrombocic pathologic condition such as intravascular coagulation, arterial thrombosis, arterial centennesis, and attended of coagulation in a mammal. An effective and safe antithrombotic therapy is provided which reduces the risk of bleeding in mammals, more particularly
                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                              YSVHWVRQAPGQGLEWMGRINPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDT 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40, useful for enhancing an immune response in a human, or treating cancer, HIV, neutropenia or viral infections.
                                                                                                                                                   The present invention relates to a pharmaceutical composition for the prevention and/or treatment of systemic Inflammatory response syndrome (SIRS), sepsis, septic shock, thrombus formation in the microvasculature and disseminated intravascular coagulation in mammals, comprising as an estive ingredient a partial inhibitor of factor VIII, in admixture with a carrier. Such inhibitors may include the antibodies B02CII and KRIXI. The present sequence is the heavy chain variable region of KRIXI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 YSVHWVRQAPGQGLEWMGRINPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDT 120

```

```
The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody variable region heavy chain protein of the invention.

```
The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomodulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating proliferation of AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, for modulating production of a cytokine from AILIM-expressing cells, for inducing antibody-dependent cytocoxicity against AILIM-expressing cells and/or immune cytolysis or apoptosis of AILIM-expressing cells (I) is useful for treating or prophylaxis of delayed type allergy. (I) is useful for treating and prevention, and for inhibiting the cnset and/or advancement of the prophylaxis of delayed type allergy. (I) is useful for treating and prevention, and for inhibiting the cnset and/or advancement of the cheumacoid arthritis, multiple sclerosis, autoimmune thyroiditis, allergic contact-type dermatitis, chronic inflammatory dermatosis, sortamis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, psoriasis, autoimmune or allergic disorders, inflammatory dermatosis, intestinal disorders such as ulcerative colitis, pneumonia, heparitis, and pancreative colitis, pneumonia, heparitis, and pancreative colitis, pneumonia, heparitis, and pancreative colitis, pneumonia, heparitis, and pancreative colitis, pneumonia, heparitis, and pancreative colitis, pneumonia, anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-human anti-hum

The present invention provides the coding and protein sequences for a number of human immune system associated proteins (HISABS). These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atherosclerosis, crohn's disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, osteoarthritis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus, arteriosclerosis, cirrhosis and cancer

                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a human anti-tumour antigen monoclonal antibody (MAD) heavy chain variable region, useful in medicine, pharmacology and biochemistry. The isotype of a MAD secreted by the human/human hybridoma HT was determined to be mu and kappa. Human MAD was purified, and the antigen recognised by human MAD CLN"-IgM identified by western blotting

                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                            Protein sequences (AAR66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (AAR678339-7902) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84, M118 and M131, by PCR amplification using primers AAQ78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placenta. The DNA was partially digested with TaqI restriction enzyme. The fragments were sparated by gel electrophoresis and 35-45 kb fractions were collected. The fragments were ligated with clar-digested cosmid vector pJ881. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The VH by genes and the DNA fragments encoding them are useful in producing human immunoglobulin in mammalian hosts. (Updated on 25-MAR-2003 to correct PN

The present sequence is the human immunoglobulin superfamily protein IGPAM-7. Its gene was isolated from a cDNA library of bladder tumour lissue. It is expressed in reproductive, gastrointestinal and immune and haematopoietic tissue, where cancer and inflammation are common. The gene, protein, its antibodies, agonists and antagonists are suitable for diagnosing and treating many diseases, including cancer, immune system disorders (such as inflammation, AIDS, allergies, anaemia, arteriosclerosis, asthma, atherosclerosis, cholecysticis, Crohn's arteriosclerosis, generalitus, emphysema, Graves' disease, hepatitis, multiple sclerosis, psoriasis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus and ulcerative colitis), complications of cancer, heemodialysis and extracorporeal circulation, trauma and haematopoietic cancer (such as leukaemia) and infections caused by bacteria, viruses, fungi or parasites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20
                                                                                                                                               Immunoglobulin superfamily proteins, the agonist and antagonist of the protein is useful for preventing and treating disorders associated with altered levels of the protein such as cancer, immune system disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MDWTWRILFLVAAATGAHSQVQLVQSGAEVKKPGASVKVSCKTSGYNFTGYSASGHIFTA

The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody therapy. The antibodies can be applied as remedies and preventives of diseases due to cells expressing TRAIL-R1 and TRAIL-R2, which are useful in the therapy of malignant tumours. Remedies produced with the antibodies are highly safe, and avoid hepatotoxicity. The present sequence represents an anti-TRAIL-R antibody amino acid sequence from the
                                                                                  New anti-TRAIL-R antibodies with activity of inducing apoptosis of cancer cells and without exerting an effect on normal cells expressing TRAIL-Rs nor inducing injury to hepatocytes, for use in therapy of malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          51 YKINWVRQAPGQGLEWMGWMNPDTDSTGYPQKFQGRVTWTRNTSISTAYMELSSLRSEDT 110

called human colon cancer antigens, given in AABS1234 to AABS4006. The human colon cancer antigens can have cytostatic, cardioactive, muscular, neuroprotective, immunomodulatory, gyraecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, or proteins and antibacies of the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, wounds, renal disorders, reproductive disorders, immune system cardiovascular disorders, reproductive disorders, and and as hybridisation cardiorates and research and cardiovascular disorders. AAC98764 to AAC98772 and AABS4007 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ы

This polypeptide comprises the heavy chain variable region of the recombinant human monoclonal antibody (MAD) 4B5. 4B5 recognises

C antibodies specific for GD2 antigen antibodies. Antibodies specific for GD2 antigen antibodies generationa, cancers including glioblastoma, neuroblastoma, compared and/or metastatic melanoma, breast adenocarcinoma, lung carcinoma, colon adenocarcinoma and denocarcinoma. The invention encompasses 4B5 derivatives with immunologic specificity for antibodies specific for GD2. These control immunologic specificity for antibodies specific for GD2. These control immunologic specificity for antibodies specific for GD2. These control immunologic specificity for antibodies specific of GD2. These include control immunologic specificity for antibodies specific for GD2. These include control immunologic specific for antibodies specific for antibodies specific for GD2. These include control immunologic specific for antibodies specific for antibodis specific for GD2. These includes control for antibodies for specific for GD2 and includes for specific for GD2. These for antibody vegtons are also provided, and therapeutic plasmids and vectors, including vaccinia virus vectors, comprising these control control control control control or specific for GD2, and is particularly control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control co

This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. BlyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunoadulatory, antirheumatic and antiAnDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant ElyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatodia arthritis, immunodeficiency (CVID) propression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            INPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDTAMYYCARADNYFDIVTGYT 139
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20
                                                                                                                                                                                                                                                                                                                                                              Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 OVOLOOSGAEVKKPGASVKVSCKASGYTFTG------YYMHWVRQAPGQGLEWMGW

                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX30020 to AAX90029 encode monoclonal antibodies which react with human connective tissue growth factor (CTGP). AAX24369 to AAX24378 represent these monoclonal antibodies. The antibodies are useful in the diagnosis, prevention and treatment of cell proliferation disorders in which CTGF is, implicated, including fibrosis of lung, Kidney, liver and other tissues; liver cirrhosis, nephritis, skin ulcers and keloid, rheumatoid arthritis; rheumatic vascular inflammation; hepatitis, and cancer.

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or AMUSSHOL-AMUSSHOL-AMUSSHOL-AMUSAN represent the amino acid sequences of novel human secreted proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 YSVHWVRQAPGCGLEWMGRINPNSGATDYAHKFQGRVTMSRDTSISTAYMELSRLTSDDT 120

The present invention describes a recombinant antibody (A) which binds to fas antigen, and controls and induces apoptosis in cells which expressed fas antigen. The complementarity determining regions (CDR) of (A) contain amino acid sequences obtained from a mammal other than human, other regions contain amino acid sequences from human and they partly contain modified amino acids. A) has immunosuppressive activity, (A) is used for treating and/or diagnosing autoimmune diseases. The present sequence represents a specifically claimed heavy chain variable region of (A)
                                                                                                                                                                                                   Novel recombinant antibody used for treating and diagnosing autoimmune diseases - is humanized anti-Fas antibody which controls and induces apoptosis in cells expressing fas antigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                US-10-044-569B-6

Sequence 10, Application US/09582337
Patent No. 6562618
GENERAL INFORMATION:
TOTAL OF INVENTION: Monoclonal Antibody Against Connective Tissue Growth Factor:
TITLE OF INVENTION: Monoclonal Insert Thereof
FILE REFERRING: J1-009PCT
CURRENT APPLICATION NUMBER: US/09/582,337
CURRENT APPLICATION NUMBER: US P1997-367699
PRIOR FILING DATE: 1997-12-25
PRIOR FILING DATE: 1998-12-15
NUMBER OF SEQ ID NOS: 27

RESULT 2 PL0106

ig kappa chain precursor V-J-C region (LS1) - human (fragment)
C;Species: Homo sapiens (man)
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 21-Jan-2000
C;Accession: PLO106
R;Silberstein, L.E.; Litwin, S.; Carmack, C.E.
B;Silberstein, L.E.; Litwin, S.; Carmack, C.E.
A;Tille: Relationship of variable region genes expressed by a human B cell lymphoma sec
A;Reference number: PLO106; MUID:89235583; PMID:2541221
A;Accession: PLO106.

A;Molecule type: mRNA
A;Residues: 1-144 <SIL>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Reywords: heterotetramer; immunoglobulin
F;1-20/Domain: signal sequence #status predicted <SIG>
F;21-115/Domain: V region <VRE>
